YOUR CLOUD ESTATE IS EVOLVING. YOUR DATA TOOLS NEED TO EVOLVE WITH IT.

Your environment didn't appear overnight. It evolved with every platform decision, every architecture review, and every workload that moved to the cloud.

The problem is that most data tools were built for a specific moment in that journey. They were designed around a fixed environment and optimised for it. Which is fine, until the environment changes. As we know, the environment always changes.

INFLEXIBLE TOOLS CAN BECOME A LIABILITY

Tools like AWS Glue and Azure Data Factory are genuinely powerful inside the environment they were designed for.

However, in an evolving hybrid world, they become less capable the further you move away from their ideal setup. This means that sometimes they can become a liability.

FME FITS IN YOUR EVOLUTIONARY TOOLKIT

This is why FME fits into your evolutionary toolkit. It's not tied to one environment. It works across on-prem, cloud and hybrid setups. It connects databases, APIs, SaaS tools, cloud platforms and legacy systems.

That matters because the goal isn't just to move data today. It's to keep data moving as the architecture shifts around you.

THE ONLY CONSTANT IS CHANGE SO BUILD YOUR TOOLKIT AROUND IT

We're not saying throw out Azure Data Factory or AWS Glue. We're saying you need an Evolutionary Technology like FME that integrates with your main data platform to make the whole environment so much more powerful.

Your environments will keep evolving. Cloud costs, data sovereignty, AI, security, vendor strategy and business demand will all continue to reshape where data lives and how it needs to move. Today's target architecture may not be tomorrow's operating model. So pick tools built for the journey and not just a single stage of it.
